CS and DS/CS arguments

For the set of words with IDs 5...6 there are two candidates: "aboridž" and "aboridžin". According to the rule defined in article A13 (highlighted text at end of page 320) the user (expert) select the second candidate stem. The same applies for the set of words with IDs 11...12 and the expert select the stem "adres". Once again, the same applies for the set of words with IDs 19...21 and the expert select the stem "agenc".

In case of the set of words with IDs 22...23 there are two candidates: "agres" and "agresiv". Only the first exist in both words and consequently the expert select the first candidate stem "agres". This is because, the sub-rule "exist in every word" has priority against the rule "the longest".

In case of the set of words with IDs 24...25 there are two candidates: "ag" and "agronom". According to the rule defined in article A13 (highlighted text at end of page 320) the user (expert) should select "ag". But it has the possibility to over-conflate (assign the same stem for words with different meaning). Thus, the expert makes a declension (more than the declensions presented in Appendix 3 of paper A13) and suggests the stem "agro" which is no one of the alternative stems provided by the primary stemmer.

				,,,		

For the set of words with IDs 42...49 there are seven candidates: "aktivira", "aktivis", "aktivn", "aktivnos", "aktivnost" and "aktivnošć". Only the candidate "aktiv" exist in every word. It is also the most frequent (2/8). Consequently the expert selects the candidate stem "aktiv".

For the set of words with IDs 60...63 there are three candidates: "albana", "albanc" and "albansk". No one candidate exists in every word. Thus, the expert makes a declension (more than the declensions presented in Appendix 3 of paper A13) and suggests the stem "alban" which is no one of the alternative stems provided by the primary stemmer. This decision of expert is explained because "alban" exist in every word and does not seem to have the possibility to over-conflate (merge with the nearby – neighbor – words).

For the set of words with IDs 81...82 there only one candidate: "alo". However, the expert is afraid that this stem is possible to over-conflate. Consequently the expert makes a declension to the rule (more than the declensions presented in Appendix 3 of paper A13) and suggests the stem "aloj" which exist in every word of the set and it is longer than the one ("alo") provided by the primary stemmer.

297	banjaluci	NA	banjaluc	DS,63	CS,3	
298	banji	NA	ba	DS,63	CS,4	

Words with IDs in the range 261 ... 267 are rearranged to define CS subsets (CS1, CS2 and CS3) for the dominating DS54.

The arguments for the words with IDs 282 ... 294 are simple CS arguments (and not DS with CS subsets) because there is not possibility (or it is very low the possibility) for over conflating (merging the words with a common stem).

January 23, 2020, Nikitas N. Karanikolas.
